Note: Holes BP05-12 and BP05-13 are on mine section 15,500 N. La Gloria vein in #12 in an ore shoot merges with Abundancia vein before reaching #13. In hole #12, the Abundancia is in an ore shoot, whereas in #13, the Abundancia is between ore shoots. The Esperancita and Carmen veins are oblique to the section, thus the reduction in width to true width. There are also several minor high-grade veinlets in #13.

The Abundancia vein structure was intersected in both BP05-14 and BP05-15 on mine grid 15,700 N and in BP05-16 and BP05-17 on mine grid 15,800 N. An ore-shoot was intersected in BP05-14. In BP05-15 to 17 base metal values are elevated, but significant

precious metal values were not intersected. A 20 cm veinlet was also intersected in BP05-14, yielding 1,084.6 Ag-Eq g/t (1.410 Au g/t, 1,000.0 Ag g/t).

The greater depth of these intersections and the andesite/conglomerate contact orientation change from east-dipping to west-dipping suggest an offset fault exists between 15,600 N and 15,700 N. The northward continuation of La Gloria vein may be further west.

BP06-52 is located in the “Cerro El Venado Sector”, 100 metres south of BP06-50, on mine section 13,900 N. Most notable in the Luz Elena (second intersection) is the high Pb content. This interval yielded 7.67% Pb, with the sub-intervals yielding 20.15% Pb and 37.41% Pb respectively.

BP06-53

Hole BP06-53 is located in “The Gap” between Zona Sur Sector and Cerro El Venado Sector. No significant intercepts.

BP06-54

Hole BP06-54 is located in “Cerro El Venado Sector”, oriented southeasterly at azimuth 145° dip -45°, to test Ramal Sur vein. No significant intercepts.

Hole BP06-63 was drilled from the same pad as BP06-61 on La Preciosa Ridge, but at an azimuth of 020° and dip -45° in order to have a more perpendicular testing of the Esperancita Vein. The hole continued on to the Abundancia Vein, with a 45 degree oblique intercept.

Hole BP06-80 is located in “La Preciosa Norte Sector”, north of La Preciosa Ridge, on mine-section 15,700 N. It was drilled at 090° azimuth and -45° dip. This hole is collared 100 m east of hole BP06-78. While the Abundancia vein is clearly a significant structure in this hole and it is mineralized throughout, only the bottom portion is in ore grade.

Hole BP06-81 is located in “La Preciosa Norte Sector”, north of La Preciosa Ridge, on mine-section 15,700 N. It was drilled at 090° azimuth and -45° dip. This hole is collared 100 m west of hole BP06-78. The major thick Abundancia vein is leached in this location and may have originally carried higher silver values. It also has significant lead and zinc.

Hole BP06-85 was collared in the flats west of La Preciosa Ridge as a deep hole in “Mina La Preciosa Sector”, west of hole BP05-07 on mine-section 15,200 N, azimuth 090, dip -50 degrees. Minor stringers exist where Abundancia Vein projects to a sandy conglomerate. The deeper structure, hosted in schist near the conglomerate contact, may match with Martha Vein and meets grade and thickness requirements.

BP06-86

Hole BP06-86 was drilled in La Preciosa Norte Sector at 090 degrees azimuth, -45 degrees dip, on mine-section 15,800 N, 100 metres east of BP06-82. Quartz vein and veinlets zones, with galena and sphalerite, were identified, but precious metal content is low.

Hole BP06-88 is located in “La Preciosa Norte Sector”, north of La Preciosa Ridge, on mine-section 15,700 N. It was drilled at 090° azimuth and -45° dip. This hole is collared 100 m east of hole BP06-80. While the Abundancia vein is clearly a significant structure in this hole and it is mineralized throughout, only the bottom portion is in ore grade.

Hole BP07-104 was collared north of La Preciosa Ridge in “Mina La Preciosa Sector”, east of holes BP05-12, 13 and west of hole BP07-102 on mine-section 15,500 N, azimuth 090, dip -45 degrees. It contains multiple silver-gold mineralized veinlets and several major veins. La Gloria vein is near the paleo-surface contact beneath the basaltic cover and is leached. Abundancia vein is at 20 degrees to core perpendicular. Carmen vein is oblique at 50 degrees to core perpendicular. Martha Vein, at 30 degrees to core perpendicular, has higher base metal values.

Hole BP07-116 did not reach target depth for the Martha Vein due to a jamming of the drill rods. It is located on the east side of La Preciosa Ridge, 200 metres east of hole BP06-65, on mine grid 14,800 N, azimuth 090, dip -50 degrees.

BP07-117

No significant intercepts were found in hole BP07-117, although stringers and anomalous lead and zinc values were located in the 478.00 to 490.90 metres interval. Hole BP07-117 is located north of La Preciosa Ridge, 100 metres west of BP07-119, on mine section 15,900 N, azimuth 090, dip -45 degrees.

Hole BP06-129 was collared north of La Preciosa Ridge, 100 metres east of hole BP07-121 on mine-section 15,900 N, azimuth 090, dip -45 degrees. The Martha structure is marked by a zone of quartz veinlets and stringers hosted in conglomerate near the andesite contact. Precious metals values are spotty, with elevated base metals Pb and Zn. The intercept in this hole does not meet grade/thickness requirements.

Hole BP06-60ext is located in the “Mina La Preciosa Sector”, high on La Preciosa Ridge, on section mine-grid 15,200 N, east of hole BP05-03, 04 and 07, plus west of hole BP06-62 and 64. Orientation was azimuth 090° and dip -80°. It was designed to pass through Abundancia vein, targeting the Luz Elena vein. Esperancita and Carmen are oblique intercepts.

The hole was initially drilled in 2006 and extended deeper in late 2007 to intercept Martha vein, with the end of hole to 517.25 metres. Martha structure is present, with elevated base metal and gold values, but is low in silver.

Hole BP06-61ext is located on La Preciosa Ridge on section mine-grid 15,300 N, 100 metres north of BP06-60. This hole was extended to a core length of 489.81 metres, thus the results below 350 metres are new reporting. It intersected obliquely the Esperancita Vein before reaching a major intercept of Abundancia vein, multiple smaller veins in the

footwall of Abundancia, then Martha vein at depth. Martha vein is hosted in conglomerates and has elevated base metals at Pb 0.69 % and Zn 2.04 %.

Hole BP06-62 was drilled in 2006 east of the outcropping Abundancia Vein in the “Mina La Preciosa Sector”, on section mine-grid 15,200 N, to test the Luz Elena vein. In late 2007 the hole was extended to a depth of 480.06 metres to test the Martha vein.

Hole BP06-67ext was initially drilled in 2006 and later extended near the end of 2007 to a depth of 556.87 metres. It is located on the east side of La Preciosa Ridge, azimuth 000°, dip -90°, on mine-section 14,800 N, 100 metres south of hole BP06-70ext. It was originally drilled to target Luz Elena vein and deepened to intersect Martha vein. Base metal content increases in a sulphide zone in the schist deeper than Martha vein.
